

SafeBLAST

Faster Than A Rocket

TOKENOMICS

Token Name: SafeBlast

Token Symbol: BLAST

Total Supply: 1,000,000,000,000,000

Over 80% Burned 🔥

Overview

SafeBlast works by taking a 10% fee on every transaction. This is divided into two parts – REWARDS and LIQUIDITY.

The REWARDS is a 5% transaction fee, which is distributed to every wallet that holds SafeBlast on a percentage basis. The more SafeBlast you hold, the more rewards you will receive. The “DEAD” (Burn) wallet, receives the most percentage to burn.

The second part is LP GENERATION, which is often referred to as Liquidity. This part get 5% transaction fee and deposited back into PancakeSwap liquidity pool, which is also LOCKED FOR 5 YEARS (2026).

These two functions work together to reward holders and punish dumpers. The LP generation function acts as an amazing risk mitigation tool because it helps to keep the market liquid. It also keeps the liquidity pool balanced, which in turn keep the price balanced.

SafeBlast (BLAST) Protocol

SafeBlast uses three easy to understand functions: **Redistribution, LP acquisition and Burn**. Every Transaction is taxed a 10% fee, which is split two ways.

5% fee is distributed to all wallet holder on the chain and the other 5% fee is split 50/50. Half of which is sold by the contract into BNB, while the other half is sold into the SafeBlast tokens. The BNB and BLAST tokens are combined automatically and added as a liquidity pair on PancakeSwap, which is automatically locked for the
